

Digital Intelligence

Gain real-time insights with the combined power of device intelligence, behavioral analytics, and historical entity profile observations.

Protect your business from sophisticated fraud attacks with unparalleled visibility into digital interactions, empowering institutions to make informed decisions and mitigate risks effectively.

Passively assess device risk

Device Intelligence

Analyze the risk of any device entering your ecosystem with real-time intelligence.

- Spot risky connections like VPNs, proxies, TOR exits
- Detect emulators, virtual machines, and automated scripts
- Understand network, geolocation and velocity information in addition to device attributes like OS, language, timezone

Analyze user behavior

Behavioral analytics

Employ advanced algorithms to capture and analyze user behaviors, enabling swift detection of anomalies and potential fraud.

- Analyze real-time user behavior with continuous monitoring with session and field level features on user interactions and timings
- Identify behaviors that may indicate a bot, credential stuffing, copy/paste actions, and liveness

Gain historical insights linked to PII

Entity profiler

Create rich historical profiles at the PII level with an online digital footprint of user activity across our vast identity graph network.

- Link PII including email address, phone number, and government ID to historical device characteristics, location, languages, and network info
- Streamline device-to-identity linkage and enhance identity proofing

“

“Socure’s Digital Intelligence helps Lili discern fraud insights for better decisioning by binding device signals to the individual using the device. The advanced geolocation capabilities can recognize fraudsters who are using a VPN to mask their actual location — without punishing other good customers who might be changing their address frequently.”

Digital Intelligence

Deploy across the entire customer journey

Mitigate sophisticated threats while delivering low-friction experiences for trusted users at every critical user interaction.

Integrate Digital intelligence with RiskOS™ workflows for real-time device and behavioral insights that optimize risk scoring across the consumer journey, including:

- New account opening
- Prefill
- Login and authentication
- Non-monetary account changes
- High risk transactions
- Account recovery
- Contact center
